Group 1
Lab 07 Model Evaluation
ITAI-1371
Viswanatha Rao

Team Member Contribution Journal

Viktoriya Kurmisheva:

Completed the Classification Report section, which focused on evaluating the Logistic Regression model using Precision, Recall, and F1-Score. Examined the results for surviving and non-surviving passengers and explained why the model performed differently for each class. Also worked on the Knowledge Check question 2 by explaining why Recall is especially important in medical screening and how different evaluation metrics apply to real-world situations. Compared the results from Lab 06 with the current lab and discussed how feature selection and data preparation could affect model accuracy. After the group finished the lab, wrote the Reflection Journal based on our observations, results, discussions, and what we learned throughout the assignment. Then uploaded the completed reflection to the group's GitHub repository.

Tien Manh Nguyen:

Completed the Confusion Matrix section by comparing the model's predictions with the actual passenger survival results and creating a heatmap to visualize the results. Examined True Positives, True Negatives, False Positives, and False Negatives to better understand the model's prediction errors. Also worked on the Knowledge Check question 1 by explaining why Precision matters in spam detection and how incorrect predictions can affect real situations. Contributed to the group discussion about how feature selection and data preparation might influence model performance. After everyone completed their assigned sections, reviewed the Jupyter Notebook to make sure the code, results, formatting, and answers were correct and consistent with the lab requirements. Then uploaded the completed notebook to the group's GitHub repository.

Zaid Alayedy:

Completed the Cross-Validation section, which focused on evaluating the Logistic Regression model using 5-fold Cross-Validation. Calculated and examined the average Cross-Validation score and standard deviation to understand how consistently the model performed across different parts of the dataset. Explored why using multiple training and validation sets can give a better idea of model performance than relying on a single train-test split. Also completed Question 3 in the Knowledge Check section by explaining the importance of Cross-Validation and how it helps us evaluate a model's performance more reliably. Contributed to the group discussion about the importance of checking model reliability rather than focusing only on accuracy. In addition, collected the contribution details from each group member and used them to write and organize the Team Member Contribution Journal. Reviewed the information to make sure it accurately described everyone's work and uploaded the completed contribution journal to the group's GitHub repository.
